

What is CJC-1295?

CJC-1295 is a tetrasubstituted 30-amino acid peptide hormone releasing hormone analog. It stimulates a release of HGH and IGF-1 without raising prolactin levels, leading to fat loss, and increased protein synthesis thereby helping growth. Our CJC-1295 is compounded without DAC (Drug Affinity Complex) because it provides a more effective GH spike in patients that resembles normal physiologic release of GH.

What is Ipamorelin and how is it Used with CJC-1295?

Ipamorelin Acetate is a Growth Hormone Releasing Peptide (GHRP) that assists increasing the amount of Growth Hormone released. Ipamorelin is a pentapeptide composed of five amino acids and has a biological half-life of 2 hours after administration. It is widely known for being able to suppress somatostatin or Growth Hormone Inhibiting Hormone (GHIH). Using CJC-1295 in conjunction with Ipamorelin may be more effective in the production of growth hormone secretion, and in helping speed recovery time from an injury.

Patient Benefits Over Time May Include:

- Promotes slow wave sleep, stimulating muscle growth and memory retention
- Promotes fat loss and lean body mass
- Increases protein synthesis thereby promoting growth of muscle

Typical Prescribing Protocol:

Dosing can significantly vary by patient, but it is commonly used at 300mcg via subcutaneous injection in the outer/upper buttock region once daily in the evening prior to sleep.
